

C-03

A device technology preventing fakes, enabling safe cooperation with others

Social Issues that we have focused on

With the spread of the Internet, it has become easy to obtain "information from a distance" posted by someone we don't know. However, we must always be skeptical about whether we can trust the information and whether it is fake. You can never get the "safe and secure information that you really want from a distance."

Initiatives to resolve issues

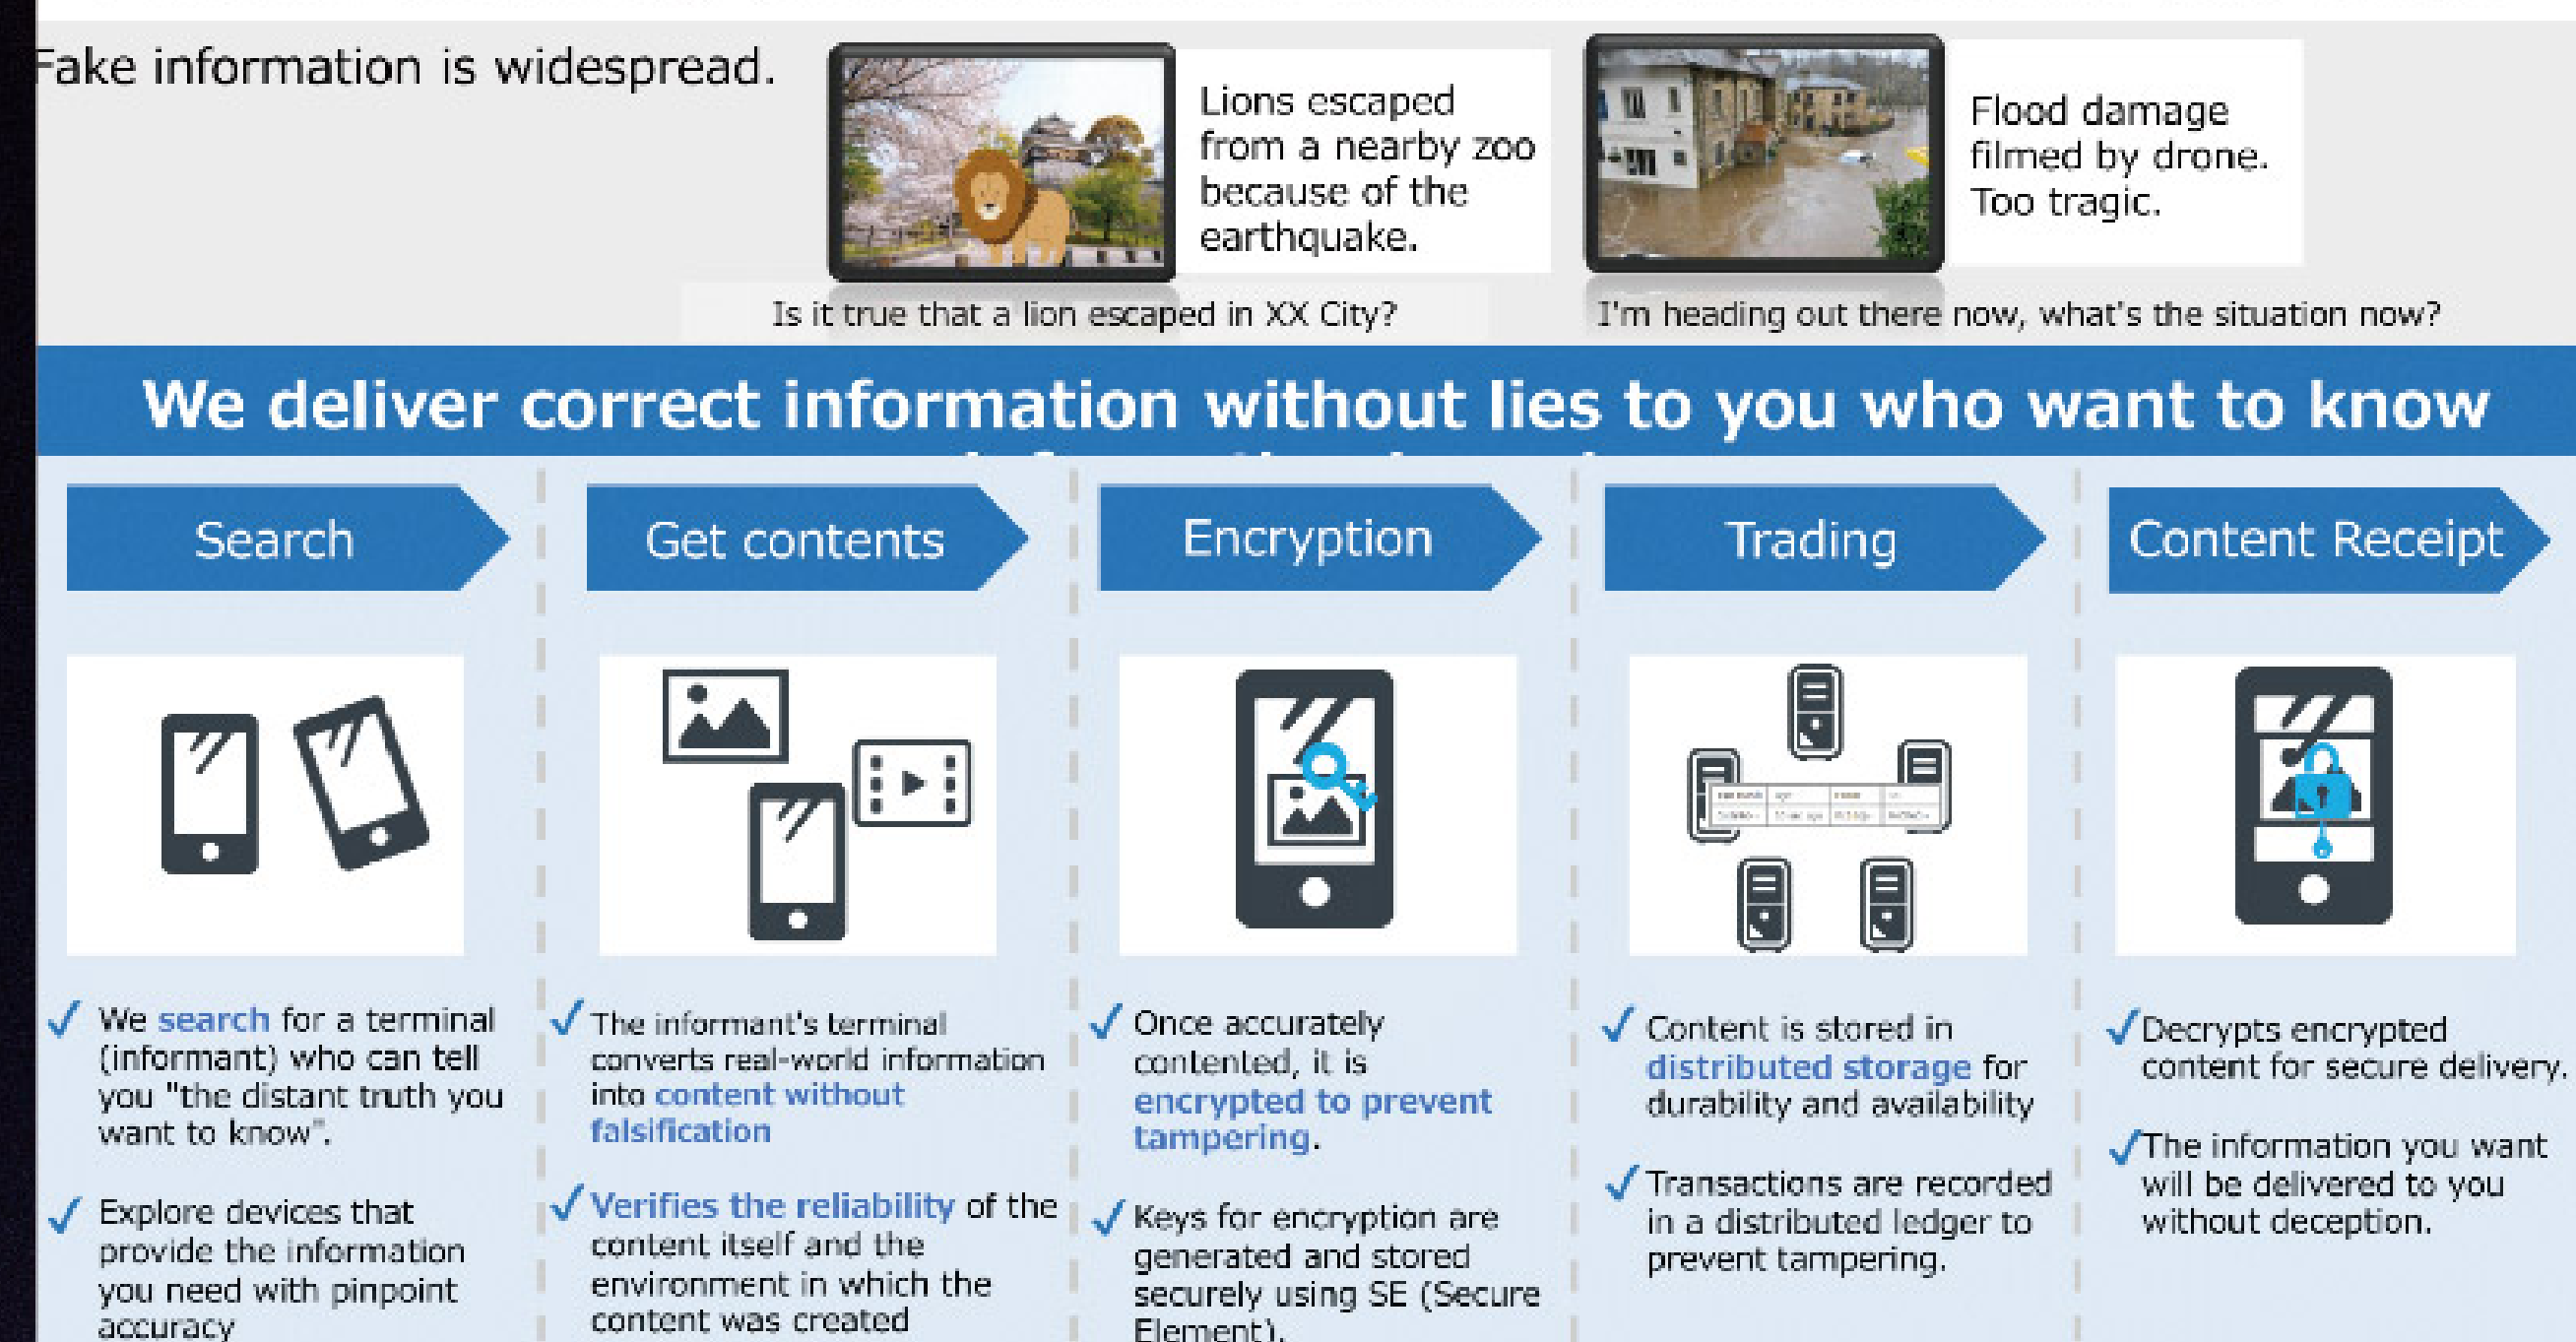

Overview

We are making an effort to develop technology that will enable the exchange of information, beginning with devices responsible for the digitization of real-world information. We connect people who seek information from a distance with strangers who hold such information, ensuring authenticity and that there is no fake information, and providing "safe and secure information that you really want from a distance."

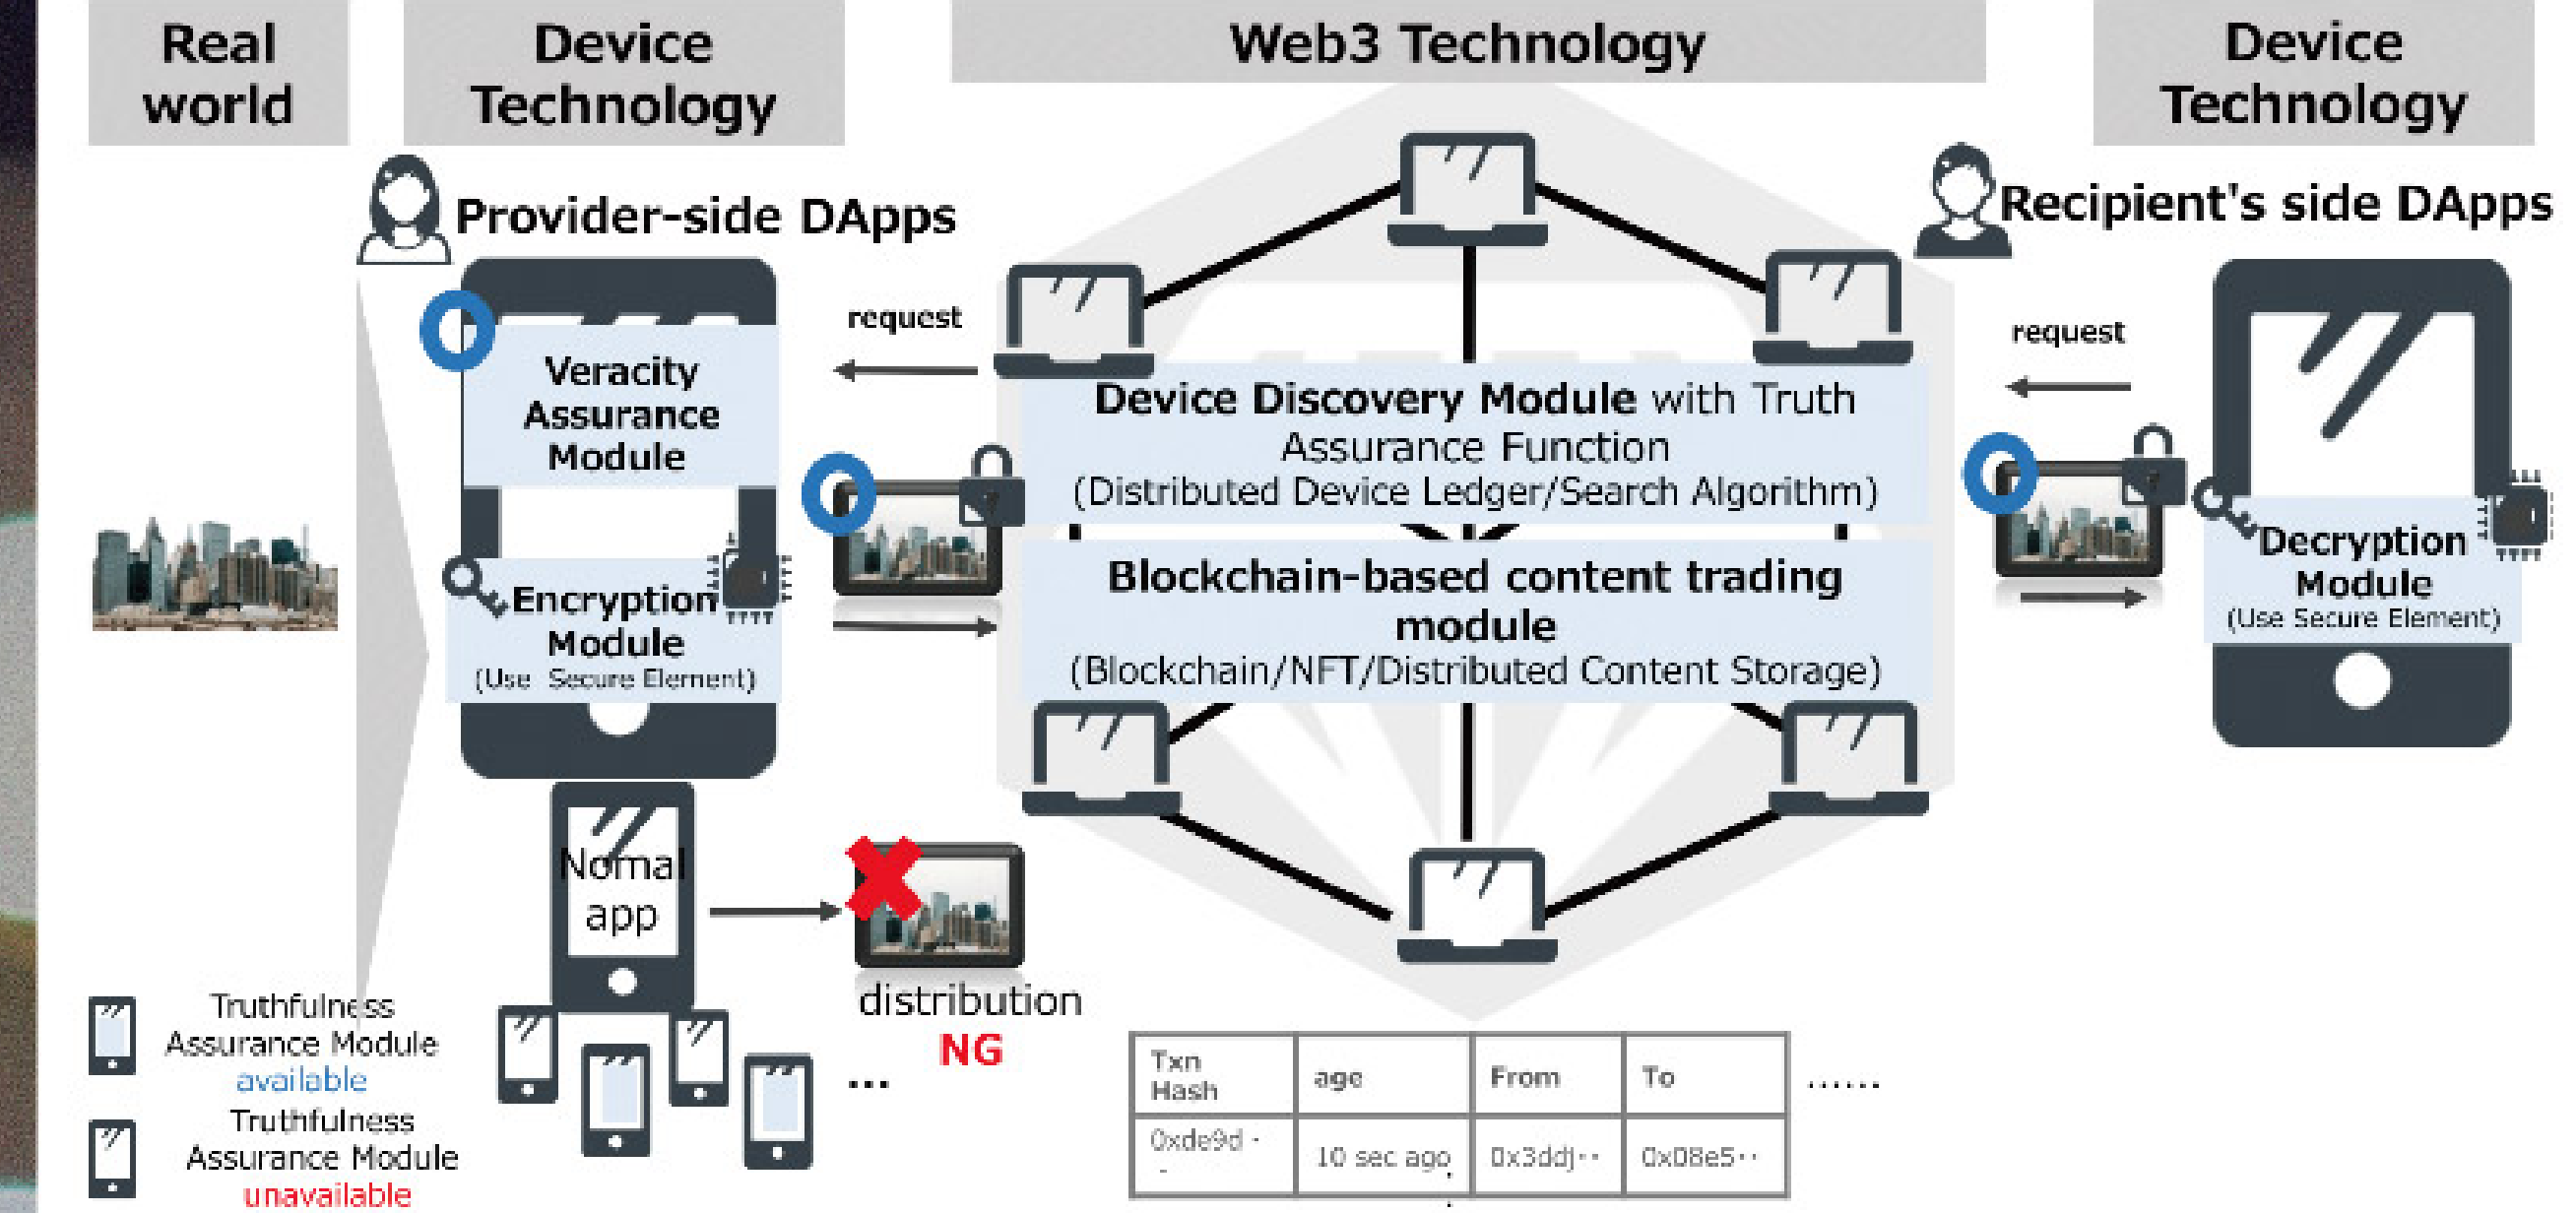

Technology to Support Initiatives

These include device technologies (SE, etc.) that ensure and encrypt the integrity of content at the generation stage, Web3 technologies that search for distant devices capable of creating content, and Web3 technologies that ensure that only content whose integrity is guaranteed is distributed and exchanged.

A device technology preventing fakes, enabling safe cooperation with others

Ensure truthfulness assurance during content generation to prevent distribution of contents at risk of falsification

With the help of a stranger,
you will be able to obtain the "truth"
of a distant place that you want to know about,
such as an area where a disaster or conflict has occurred,
or a place you are heading to.

We will create a world in which strangers can help each other discover the "truth".
